

# Advances in Dental Technologies Aids Patients in Improving Quality of Life

Mr. Ashish Gujrathi

## ABSTRACT

**Background:** Once in a while, new innovations emerge in the world of restorative dentistry. The emergence of new bonding agents, dental liners and bases, and adaptive capabilities of components offer new opportunities. Dental liner materials have improved tremendously over the last few years. They are applied in a thin layer to seal the walls of the cavity or minimize the influx of bacteria following restorative procedures. On the other hand, dental bases are applied in thick layers and support a restorative material during the placement as well as function. The dental liners and bases are widely used to improve the outcome of dental caries treatment and several dental restoration procedures. Apart from this, dental technology has improved a lot over the last few years and will continue to advance the field and benefit patients and healthcare professionals alike. While Covid-19 presented various uncertainties during the pandemic, it is safe to say that the pandemic increased patient awareness about safety measures and sanitation, which will boost the demand for dental technologies. Here are some of the dental technologies which will be a big hit in the coming years.

**Keywords:** restorative dentistry, dental liners, pandemic
